

Figure RQ7.4: Spearman Correlation — Risk-Aware Metrics vs Deployment Safety
(per-image, n=478, BDD100K val, datos reales)

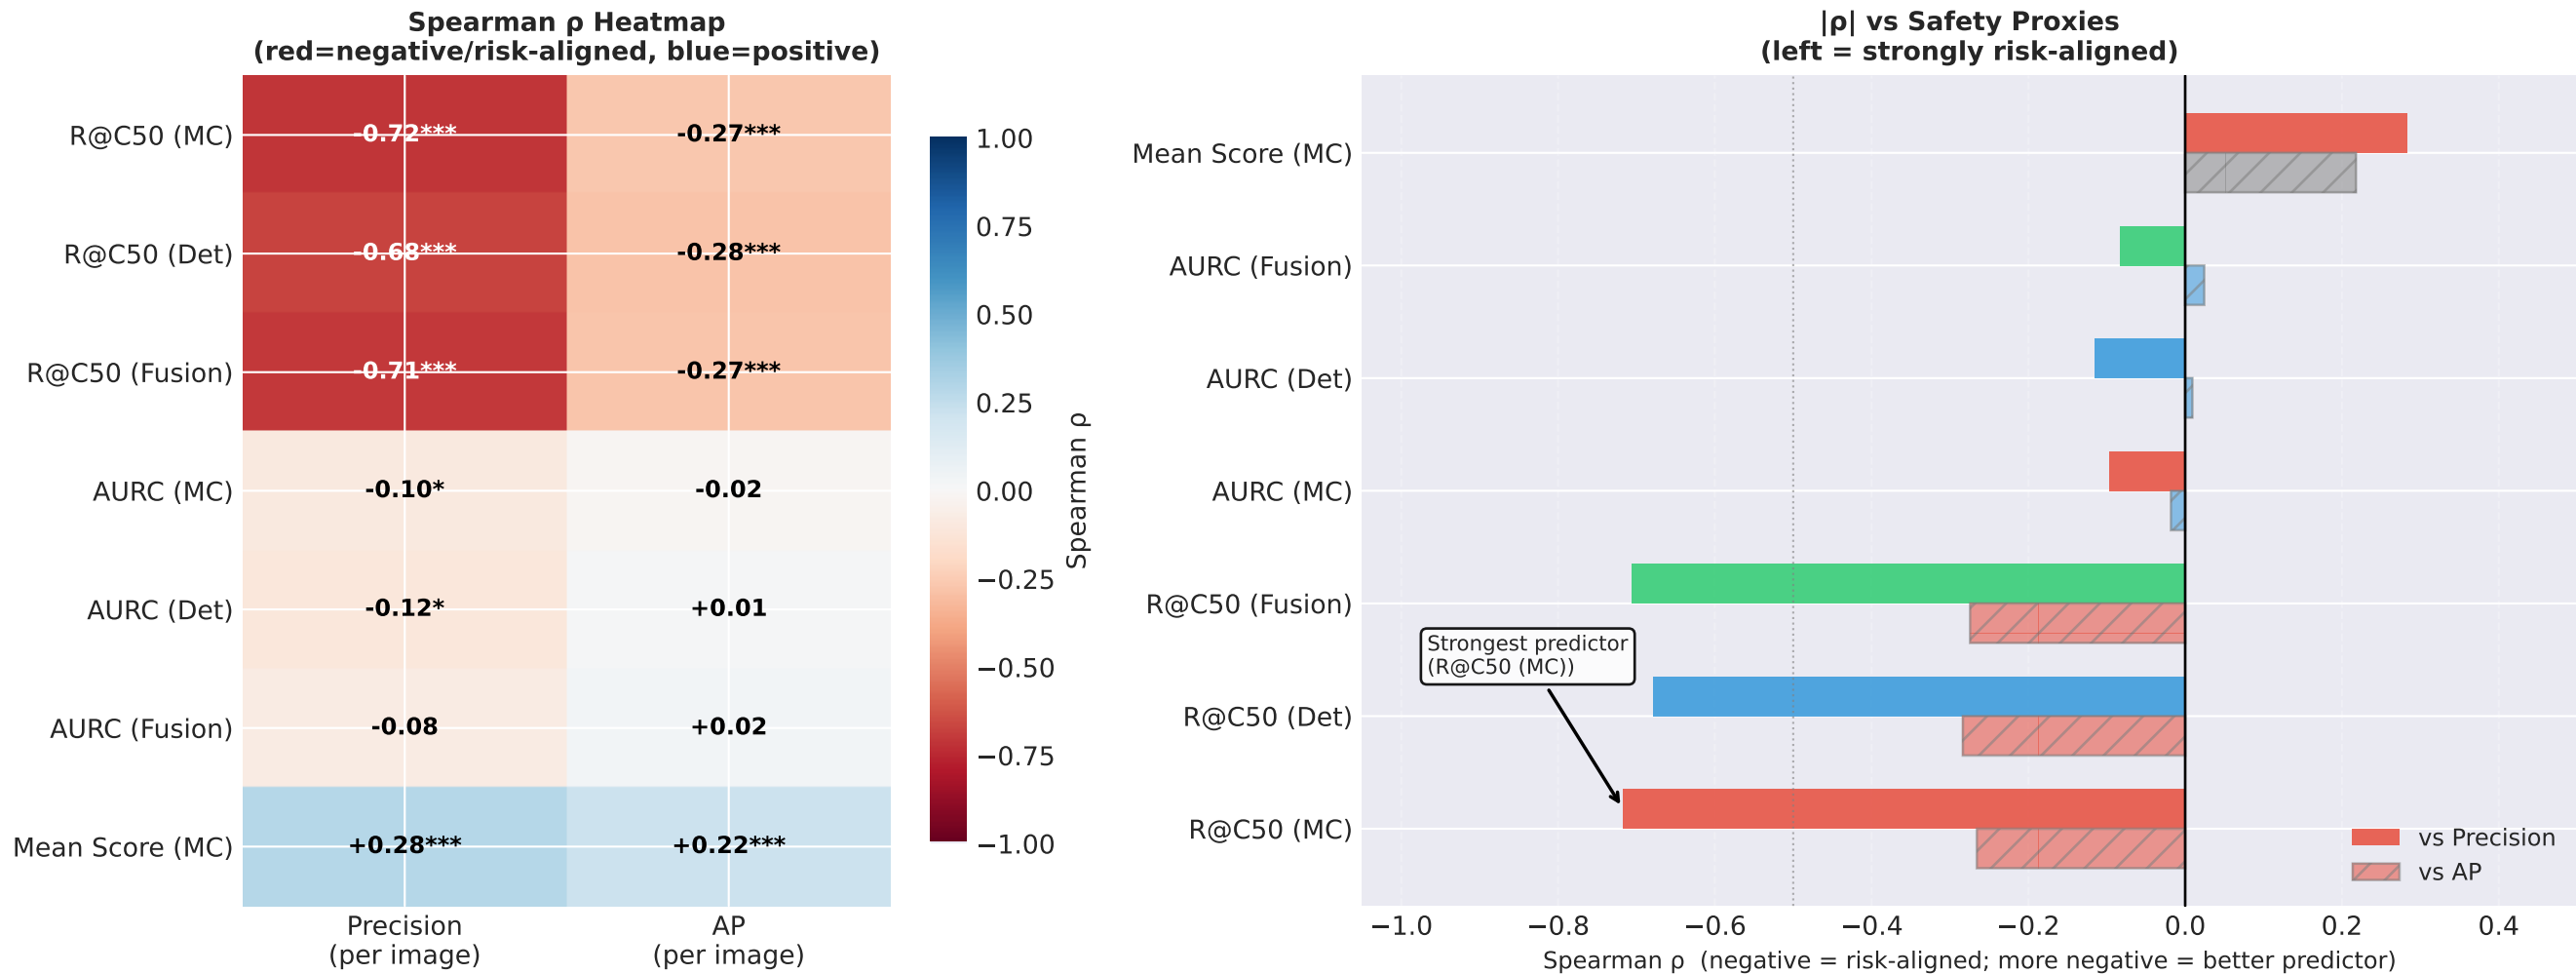

Figure RQ7.4. Spearman ρ between risk-aware metrics and per-image deployment safety. R@C50 shows the strongest alignment with operational safety (precision proxy): $\rho \approx -0.72$ (MC), -0.68 (Det), -0.71 (Fusion). Per-image AURC has near-zero correlation with AP ($|\rho| < 0.03$), limited by small per-image sample sizes. mAP (mean score proxy) correlates at $\rho \approx +0.28$, substantially weaker than R@C50. *** $p < 0.001$, ** $p < 0.01$, * $p < 0.05$.
